Cr and V in Fe is formed on the surface with disseminated carbides. From this study it was evident that the growth rate of the carbide phase, its depth, hardness and structure of the near-surface zones are affected by the carbon concentration and diffusion rate into alloys with a different chemical composition. Ine figure, one table, three bibliographic references.

"Influence of Galvanic and Nonmetallic Coatings on Endurance of Martensitic
Stainless Steel"

Kiev, Fiziko-khimicheskaya Mekhanika Materialov, Vol 8, No 4, 1972, pp 12-15.

Abstract: This work describes a study of the influence of galvanic (nickel-cadmium) and polymer coatings on the strength of type 1Kh12N2VMF stainless steel under cyclical loading at various temperatures and in the presence of corrosive media. Before the coatings were applied, the specimens were heat treated by hardening from 1,020°C and tempering at 660°C (3 hours), as well as low temperature annealing at 725°C (3 hours). Metallographic studies showed that application of the nickel-cadmium coating to the surface formed an even, thin layer with a total thickness of 9 to 15 μ , the cadmium layer being 2 to 3 μ thick. The nickel-cadmium coating has a negative influence on the endurance limit in air, but more than doubles the corrosion fatigue resistance in 3% NaCl. Nickel-cadmium coatings protect steel well from the effects of high temperatures. The polymer coating, about 0.1 mm thick, had 1/2

no influence on the endurance of the steel in air, but more than tripled the corrosion fatigue resistance in 3% NaCl. The effect was maximum with high loading amplitudes and fewer cycles (up to 10^7). Corrosive damage to the metal beneath the polymer coating was found to result primarily from damage to the polymer coating caused by the loading stress, allowing the corrosive medium to penetrate through the coating to the steel.

"Endurance of Chemically Nickel-Plated Aluminum Alloy D16"

Moscow, Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 364-367

Abstract: The article describes results of a study of the effect of chemical nickel-plating on the fatigue and corrosion-fatigue strength of D16, an aluminum alloy widely used in industry (0.74 percent Mn, 4.6 percent Cu, 0.87 percent Si, 0.56 percent Fe, 1 percent Mg). Specimens were nickel-plated in an alkaline solution of the composition (g/l): NiCl_2 21, NaH_2PO_2 24, $\text{NaO}_2\text{C}(\text{CO}_2\text{H})_2(\text{OH})\text{C}_3\text{H}_4$ 45, NH_4OH 50, NH_4Cl 30 at a temperature of 75-80°.

Fatigue tests showed that the endurance of aluminum alloy D16 with a nickel layer of about 0.045 (nickel-plating for three hours without subsequent heat treatment) is no less than that of the alloy without a coating, despite the presence of residual tensile stresses. Heat treatment of chemically nickel-plated specimens at 240° for one hour significantly increased their fatigue

1/2

USSR

KARPENKO, G. V., et al., Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 364-367

strength. The endurance limit of specimens with a coating about 0.008-0.010 mm thick (nickel-plating for 0.5 hour) increased 45 percent compared to uncoated specimens and specimens nickel-plated without subsequent heat treatment. An increase in the coating thickness to 0.040-0.045 mm led to a further rise in the endurance limit to almost 70 percent. The effect of a rise in endurance declines somewhat with a further increase in the coating thickness to 0.070-0.075 mm (nickel-plating for five hours). In the case of the simultaneous action of cyclic strains and a corrosive medium (3-percent aqueous solution of sodium chloride), chemically deposited nickel is not an effective means of protection against corrosion-fatigue failure of aluminum alloy D16.

"A Procedure for Testing Materials for Strength at Elevated Temperatures and With Periodic Wetting by a Liquid Corrosive Medium"

Moscow, Zavodskaya Laboratoriya, No 10, 1971, pp 1243-1245

Abstract: For evaluating the fatigue strength of blade material of special power installations (boiler units), a new procedure has been developed for the fatigue testing of heated samples periodically wetting by sprinkling with a corrosive medium (water, sea water, etc.); the conditions of such tests are similar to those encountered in operation. The article describes a method and a machine for the fatigue testing of materials, with the simultaneous action of elevated temperatures (up to 400°C), variable stresses, and periodic wetting of the samples by a corrosive medium. The temperature fluctuations during these tests under conditions of elevated temperatures comprised $\pm 5^{\circ}\text{C}$, the periodicity of the cycle was 1.5 minutes, the corrosive medium was distilled water. Tests results are presented for samples of steels 1KH12N2VMF and 1KH12N2MVFA. 2 figures. 1 table. 8 references.

Vliyaniye Diffuzionnykh Pokrytiy na Prochnost' Stal'nykh Izdeliy (The Effect
of Diffusion Coating on the Strength of Steel Parts), Kiev, "Naukova Dumka,"
1971, 166 pp.

Translation of Annotation: This monograph studies the effect of electro-plating and diffusion coating on the short-term static and fatigue strength of steel articles in the air and in some working media. The role of residual stresses is examined and a new classification is proposed for them. The possibility of healing such defects as cracks through diffusion metallization and the restoration of the continuity and strength of defective parts is shown. Some methods of intensifying the processes of diffusion saturation are presented.

This monograph is intended for metal scientists, process engineers, and designers in the machine building industry, and for instructors at higher educational institutions.

"Effect of Alloying Elements on the Cyclical Durability of
Medium-Carbonized Steel After Boronizing"

Kiev, Fiziko-Khimicheskaya Mekhanika Mekhanika Mateiralov, Vol 6, No 5,
1970, pp 18-21

Abstract: To obtain the proper steels for their experimental research, the authors used each of the following elements: silicon manganese, nickel, and chromium. These were added to the extent of one or two percent to medium-carbonized steel (type 45 alloy). The boron was diffused by the contact method in a powdered mixture of boron carbide and borax for six hours at a temperature of 950° C. The structure of the diffused layers and the mechanical characteristics of the steels before and after the boronization process as well as the method used for investigating the cyclic durability of the steels in air and in the corrosive medium were described in an earlier paper 1/2

USSR

PROESIK, V. G., et al., Fiziko-Khimicheskaya Mekhanika Materialov,
Vol 6, No 5, 1970, pp 18-21

by the authors for this same journal (No 6, 1969). The results of the experiments showed that the alloying elements in the medium-carbonized steels in the one or two-percent concentration affected the durability of the steels in different ways, in air and in the corrosive medium, before as well as after boronizing. After boronization, the durability limit in all steels treated with the above-named elements increased. The greatest effect on the durability was observed for the steel to which silicon in the amount of 1% was added.

EPR SPECTRA AND RADIRESISTANCE OF SOME SPECIES
OF THE DEMATIACEAE FAMILI

D. K. Zabolotni Institute of Microbiology and Virology,
Academy of Sciences, UkrSSR

Analysis of EPR spectra in fungi of the Dematiaceae famili has shown that the concentration of paramagnetic particles in this case is at least by 3—4 orders higher than in the fungi lacking this pigment, this amounting to 10^{17} — 10^{18} pp/g. A symbiotic dependence of radiresistance of 7 species (9 strains) of darkcoloured hyphomycetes on the concentration of pp was found. The radiresistance of the samples increased parallel to the increment of the amount of p. particles.

"Welding With Powder Rod"

Svarka poroshkovoy provolokoy [Translation Above], "Naukova Dumka," Kiev, 1972, 221 pp

Translation of Foreword: Arc welding is a basic process in the production of metal structures. The mechanization of this process is one of the basic directions in the growth in the welding industry. In the post-war years in the Soviet Union, mechanized welding using a flux was rapidly expanded. The absolute increase in the number of applications of flux welding occurred at this point, and now this portion of the process of welding operations has, to a large extent, been stabilized. This is related to the rapid growth of welding using carbon dioxide. The high productivity, simplicity, and economics are the distinctive features of carbon dioxide welding. However, the increased splattering of the electrode metal, the inconvenient form of the junctions, and their unsatisfactory flakiness resulted in the necessity of developing new electrode materials. The application of powder rods was an effective solution.

Welding both using a flux and in protective environments is used now,

1/5

USSR

POKHODNYA, I. K., et al., Svarka poroshkovoy provolokoy, "Naukova Dumka",
1972, 221 pp.

principally in working conditions. At the same time, millions of tons of welded structures are made and assembled in open areas and in field conditions. Here, however, manual welding is dominated by plated electrodes for the mechanization of the welding process. Self-protecting powder rods result in a great increase in welding productivity over welding using the plated electrodes and provide a high-quality joint. The volume of production of the powder rods has increased overall and the areas of its application have expanded. From 1965 to 1972 the output of powder rods in the USSR has increased 5 times. In the current five year plan, the development of the welding industry from 1971 to 1975 provides for a tripling of the output of the powder rods for different purposes.

Studies on the composition of powder rods used in the welding process and the development of industrial technology for their production have been studied by the authors in detail over the last 15 years at the Institute of Electric Welding imeni Ye. O. Paton, Academy of Sciences UkrSSR. These studies received recognition both at home and abroad. Firms in several capitalist countries acquired licenses for the powder rods developed at the Institute of Electric Welding and supervised their production. The United States, England,

2/5

USSR

POKHODNYA, I. K., et al., Svarka poroshkovoy provolokoy, "Naukova Dumka", 1972, 221 pp.

Germany and France use these rods for welding critical structures.

Results of the study of the welding process using powder rods and experiments on its application occur in the periodical literature and in different books. The present monograph is the first attempt to generalize the results of the authors and other investigators. The first three chapters of the book acquaint the reader with the processes occurring during the heating and fusion of the powder rods. Based on experimental material, processes are considered for the reduction of the metal and also logical ways to construct reliable gas and slag protection providing the optimum welding technology characteristics. The content of the following chapters deals with applications. In these the characteristics of industrial brands of powder rods are given. The basic technological processes of welding are presented together with the technical-economic efficiency of the application of powder rods to different branches of industry.

"Development of Research in the Metallurgy of Welding and the Technology of Electrode Production in the USSR"

Kiev, Avtomaticheskaya Svarka, No 5, May 70, pp 18-24

Abstract: A review is presented of literature on the development of research in welding metallurgy and the technology of electrode production in the USSR. The review comprises the theoretical fundamentals of electrode creation, investigations of electrode production procedures, designs and development of equipment, and structure of the production and basic characteristics of new electrodes. Electrodes with different types of coatings are discussed, and their characteristics are described. Results of the comprehensive investigation of problems of welding special steels and alloys have resulted in the development of new electrodes (the KTI-7, OZL-18, OZL-9A, IMET-10, NIAT-7, NIAT-8, TsT-22, TsT-28, and others) ensuring a built-up metal with high heat and oxidation resistance. For surfacing of the working parts of excavators, the OZN-1, VSN-6, and KBKh-45 electrodes developed. Service life of these machines has increased 6-8 times. Many machine-building plants are successfully using the EN-60M, OZI-2, and OZSh-1 1/2

USSR

POKHODNYA, I.K., Avtomaticheskaya Svarka, No 5, May 70, pp 18-24

electrodes for due surfacing. For the welding of cast iron, MNCh-1, OZCh-1, and TsCh-3A electrodes, with cores of nonferrous metals and high-alloy steels, have been developed. The development of new electrodes for special steels has contributed to a substantial expansion of the areas of welding and surfacing application, and has resulted in the creation of unique welded structures for operation under extremely complex conditions. Greater service life and wear resistance of machines and mechanisms have also resulted. However, the absence of specialized production of certain brands of electrodes has seriously hampered their adoption. Further improvement in the technology of producing such electrodes is imperative.

"Combustion of Aluminum Particles in the Flame of a Condensed System"

Fizika Gorenija i Vzryva, No 1, Mar 71, pp 51-57.

ABSTRACT: This work presents a study of the process of combustion of aluminum particles in a flame of type N ballistite powder and a model mixture of ammonium perchlorate with organic fuel. The study of the process of combustion of metal particles was performed in a constant pressure bomb with quartz windows, in which a vacuum or the necessary inert gas (nitrogen, argon) pressure was created. The metal particles were introduced to the composition of the fuels during the manufacturing process. A photographic method was used to study the processes occurring on the surface of combustion, and specimens were taken to study the dimensions of the metal particles through the height of the flame. It was established that as ballistite powder burns, the metal particles adhere to the thermostable decomposition products of the nitrocellulose, later merging near the surface of the charge. Increasing the percentage of metal in the fuel causes an increase in particle diameter. Aluminum particles accumulate and

agglomerate on the surface of combustion of the charge. In the initial stage of combustion, oxidation of the metal occurs on its surface, with 4 to 6% of the heat realized due to combustion of the metal liberated in this manner in the reaction layer. Combustion of aluminum particles in the flame occurs through intermediate products with the formation of lower oxides. The temperature of the combustion zone of aluminum particles is 400-600° higher than the temperature of the remainder of the flame.

"Hydrogen Distribution in the Heat-Affected Zone of an Alpha-Titanium Alloy
with Consideration of the Thermal Diffusion Phenomenon"

Moscow, Fizika i Khimiya Obrabotka Materialov, No 4, Jul-Aug 73, pp 134-137

Abstract: The problem of the heterogeneous distribution of hydrogen in the weld joint of an alpha-titanium alloy was examined where the distribution was formed as a result of the phenomenon of thermal diffusion. The reason for the heterogeneity of hydrogen distribution was believed to be the establishment of isosteric pressure gradients due to the temperature relationship of the solubility coefficient k in the metal, which results in pressure drops and a new hydrogen distribution in the weld joint heat-affected zone. Pipe of the alpha-titanium alloy was welded to check the theoretical data with a hydrogen content in the alloy of 0.02% and in the welding rod -- 0.002%. After welding, the hydrogen content was determined and plotted against the distance from the end of the pipe. It was found that there are two sections with an increased content of hydrogen, above that of the initial pipe. The first section is found close to fusion line (2 mm from 1/2

USSR

FROLOV, V. V., et al., Fizika i Khimiya Obrabotki Materialov, No 4, Jul-Aug 73, pp 134-137

the center of the seam) and the second section -- in the heat-affected zone approximately 3 mm from the fusion line. The first section had a hydrogen content of just over 0.02 wt.% while the second section contained almost 0.03 wt.% hydrogen. Thus, the experimental data agree with the calculations and confirm the theoretical conclusions about the effect of thermal diffusion processes on hydrogen distribution in the heat-affected zone. Two figures, seven bibliographic references.

"Invariant Adaptive System for Longitudinal Stabilization of Aircraft"

V sb. Teoriya invariantn. i teoriya chuvsvit. avtomat. sistem. Ch. 1 (The Theory of Invariance and the Theory of the Sensitivity of Automatic Systems. Part 1 -- Collection of Works), Kiev, 1971, pp 320-335 (from RZh-Mekhanika, No 9, Sep 71, Abstract No 9B279)

Translation: The possibility of constructing an autopilot on the principle of compensation of perturbing effects which would maintain with high accuracy a constant angle of pitch of the aircraft under the action of vertical gusts of wind is discussed. Since an aircraft statistically neutral with respect to the angle of attack cannot undergo angular accelerations with changes in the angle of attack under the action of gusts, this problem is solved by imitation of such neutrality through the control system. It is assumed that a signal is supplied to the input of the autopilot drive, the components of which are proportional to the angle of pitch, the angular rate of pitch and acceleration with respect to the vertical axis of the aircraft. In total the system takes on invariance with respect to the angle of pitch to the action of a vertical wind under the condition

of continuous tuning of the coefficient for a vertical acceleration signal which must be achieved with adaption chains. Two possible designs of the adaption chain are discussed and the effect of a continuous change of the parameters of this chain on the accuracy of maintaining the angle of pitch is evaluated. Also evaluated are the effects of the drive parameters and the presence of additional components in the structure of the accelerometer signal when it is not installed at the center of gravity of the aircraft. Modeling of both adaption designs showed their suitability for application. However, in those cases when the dynamics of the adaption chain were insufficiently "slow" as compared with the dynamics of the basic circuit, autooscillations were observed in the modeling. G. S. Aronin.

"Problem of Studying Critical Thermal Fluxes in the Case of Forced Movement of Water"

V. sb. Vopr. teplofiz. yadern. reaktorov. Vyp. 3 (Problems of Thermophysical Nuclear Reactors, vyp. 3--collection of works), Moscow, Atomizdat Press, 1971, pp 32-38 (from RZh-Mekhanika, No 11, Nov 71, Abstract No 11B668)

Translation: Distilled water was boiled in a copper tube with an inside diameter of 5 mm and 80 mm long. The experiments were performed at pressures of 1.5 and 30 bars with underheating of the liquid close to zero in the range of mass velocities W_p from 40 to 20,000 kg/m²-sec. A low-inertia oscilloscope was used in the experiments to measure the flow rate through the operating channel, the vapor content at its exit, and the wall temperature of the channel. It was established that in thermal fluxes close to critical, high frequency (~10 hertz) pulsations of the vapor content develop in the channel at the exit and corresponding pulsations develop in the water flow rate through the channel. At $W_p < 2 \cdot 10^3$ kg/m²-sec, the mass flow rate during the pulsations reaches practically zero values. Choking the flow before the working channel reached 5-7 absolute atmospheres, and the ordinarily used electron devices of

USSR

KRONIN, I. V., et al., Vopr. teplofiz. yadern. reaktorov. vyp. 3, Moscow,
Atomizdat Press, 1971, pp 32-38

the EPID type with DM-6 and the standard manometers failed to record any pulsations. The noted phenomenon is most clearly exhibited at low pressures and low velocities. The dependence of q_{cr} on W_p turned out to be nonmonotonic. In the range of low velocities $q_{cr} \sim W_p^{0.5}$ and q_{cr} can be appreciably smaller than in a large volume. In the medium velocity range the dependence on the velocity is strongest $q_{cr} \sim W_p^{1.2}$, and at high velocities (a pressure of 30 bars) a region is observed where the increase in velocity by more than an order either has no effect or weakly reduces q_{cr} . The nature of the oscillograms obtained permits the conclusion that in these three regions the mechanism of occurrence of the crises differs qualitatively. The bibliography has 14 entries.

Triprotamines in the form of sulfates were isolated from the milt of individual sturgeon stocks. The amino acid composition of triprotamines was determined and their antitumor activity was studied. It was shown that protamine from *Ac. guldenstadtii* and *Ac. stellatus* inhibited tumor growth by 60-80 per cent, while protamine from *Ac. nudiventris* was practically inactive.

"Investigation of Interaction Between Interferon, Antibodies, and Leukocytes in In-Vitro Experiments"

Moscow, Voprosy Virusologii, No 4, Jul/Aug 71, pp 456-459

Abstract: Mutual effects of the presence of interferon and antibodies in plasma on the production of antibodies or interferon by immune and nonimmune leukocytes and on the total immunological titers against a number of viruses grown in chick fibroblasts were studied using chicken, mouse, and rabbit antisera and human and chicken leukocytes. Newcastle disease virus (NDV) antibodies present in homologous (chicken) antiserum in a concentration 20 times smaller than that in heterologous (rabbit) antiserum completely inhibited interferon production in chicken leukocyte suspensions. Mutually enhancing antiviral effects of interferon and antibodies against NDV and influenza A/WSN virus were regularly observed only when the antisera were homologous to the tissue cultures in which the total antiviral effect was being determined. Chicken leukocytes washed from antiserum and immune to NDV and Chikungunya virus produced as much interferon as nonimmune white blood cells. NDV-immune leukocytes added to a culture of infected chick fibroblasts partly inhibited 1/2

USSR

MARCHENKO, V. I., et al, Voprosy Virusologii, No 4, Jul/Aug 71, pp 456-459

the development of the disease, while nonimmune leukocytes exerted no inhibitory action. In all probability, immune leukocytes, in contrast to non-immune leukocytes, block the infected cells and thus prevent the spread of the virus infection throughout the tissue.

"Stimulation of Interferon Formation in Producing Cells by Pretreating them with
Interferon"

Moscow, Voprosy Virusologii, No 2, Mar/Apr 70, pp 150-155

Abstract: Pretreating human and chicken leukocytes, fibroblasts of skin muscle tissue of human and chick embryos, human amnion and chorioallantoic membrane of chick embryo with interferon results in stimulation of subsequent interferon production in these tissues. Tissues supporting multiplication of the virus-inducer (Newcastle disease virus) treated with large doses of interferon showed inhibited interferon formation while those treated with small doses exhibited stimulated interferon formation. Either large or small doses of interferon stimulated interferon production of cells not supporting virus multiplication. The stimulating effect reached a maximum after 2 hours, and disappeared after 24 hours. The stimulation and inhibition process of interferon production is species-specific. Stimulation of interferon formation was also observed after pretreatment of the tissues with small doses of the virus inducer.

"Evaluation of the Second Eigenvalues for Several Classes of
Positive Operators"

Moscow, Matematicheskiye Zametki, Vol 9, No 1, Jan 71, pp 27-33

Abstract: The uniform additive operator A, which is positive for K, is investigated in Banach space E, which is partially ordered with the aid of the cone K. It is suggested that the cone K is reproducible in E and that the operator A has in K an eigenvector u_0 : $Au_0 = \lambda_0 u_0$. The following theorem is proved.

Theorem. Let the uniform additive operator A have a non-zero eigenvector $u_0 \in K$: $Au_0 = \lambda_0 u_0$ and for a certain $\rho > 1$

$$AK \subset Ku_0, \rho.$$

Then any other eigenvalue of λ of the operator A will satisfy the inequality

1/2

Translation: The statistical characteristics of telemetry information from the "Zond-1" and "Venera-4" space probes are analyzed. The distribution of the number of active channels is calculated using an excess of the channel value above a certain threshold generated by a zero-order predictor as a criterion for channel activity. The distributions are calculated for various values of predictor threshold and for several periods of interrogation of the spacecraft sensors. Data are produced on slight changes in the mean number of active channels during communications sessions at widely differing flight times. The distribution of relative activity of channel groups is calculated. The statistical characteristics studied are used to determine the compression factor for two possible data compression systems. 6 Figures; 2 Tables; 2 Biblio. Refs.

"One Method of Establishing Paradigmatic Relationships in the Construction of Information Retrieval Thesauri (Preliminary Report)"

Moscow, Nauchno-Tekhnicheskaya Informatsiya, Seriya 2, No. 3, 1971, pp 30-32

Abstract: In the construction of an information retrieval thesaurus it is necessary to determine specifically which words in natural language should be associated with each other. Various methods, including psychological methods, exist for this work, but all the more effective methods are extremely cumbersome if all of natural language is used as the field from which descriptors and synonyms are selected. The experiments of the author indicate that a simpler approach can be taken. A number of words selected at random from bibliographic descriptions of technical words on metallurgy were looked up in a large number of technical dictionaries, encyclopedias, etc., and only those words which occurred in the definitions in these various sources were accepted as the word field to which the more precise methods of thesaurus construction were applied. The author states that this method results in a significant decrease in labor expenditures without reducing quality of construction of a thesaurus.

Tr. Kuybyshev aviats. in-t (Works of Kuybyshev Aviation Institute), 1970,

No. 45, pp 313-320 (from RZh-Aviatsionnyye i raketnyye dvigateli, No 4,

Apr 72, Abstract No 4.34.70)

Translation: A corrugated damper for quenching rotor vibrations is a further development of laminated dampers of smooth strips and is distinguished from the latter by a considerably higher bearing capacity, stability in characteristics and use for directed change over wide limits. The higher effectiveness of corrugated dampers as compared with ordinary dampers is supported by the results of comparative tests where with a corrugated damper one could achieve a reduction in rotor vibrations of more than a factor of 1.5. A computational method is proposed for determining the rigidity and the damping force of a corrugated damper, i.e., the basic parameters necessary for calculating rotor vibrations. 6 ill., 3 ref. "In vitro Antagonistic Activity of *E. coli* (Strain M-17) and *B. bifidum* (Strain 1) Against El Tor Cholera Vibrios"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 10, 1972,
pp 54-59

Abstract: The antagonistic activity of *E. coli* (strain M-17) and *B. bifidum* (strain 1) against 11 El Tor cholera vibrio strains (Inaba serotype 6 and Ogawa serotype 5) was studied in mixed cultures in vitro. During the first 6 hours of combined cultivation of *E. coli* and a cholera vibrio strain both microbial species grew, but the number of live vibrios began to decrease after 24 hours and after 48 hours almost all were dead. *B. bifidum* had a similar inhibiting effect on vibrio growth. In the presence of both antagonistic strains, all the vibrios died within 48 hours without reproducing in the initial period of cultivation. It is suggested that the antagonistic activity of the two strains under study might be duplicated in an intestinal biocenosis and that a preparation made from these microorganisms (a combination of colibacterin and 1/2

USSR

(from RZh-Meditsinskaya Geografiya, No 3, Mar 71, Abstract No 3.36.258)

Translation: During the last seven years, the incidence of typhoid has decreased each year by 6-7% on the average in this country. Maximum drops were observed in the Belorussian SSR, Kazakh SSR, Lithuanian SSR, Latvian SSR, Armenian SSR, and Estonian SSR; minimum drops were found in the Uzbek SSR and Kirghiz SSR. During the last two years, the incidence of typhoid was 10% higher among rural residents than among urban residents. In comparison with 1964, a drop in incidence of approximately 40% was observed; in rural locations, the drop was 23%. The leading significance of the water factor in transfer and distribution of the agent of typhoid is

DETERMINING MICROELEMENTS IN HUMAN FOOD MATERIALS AND EXCRETA USING THE EXTRACTION METHOD

Existing methods for the direct spectrophotographic and atomic-absorption determination of microelements in biological objects are not always satisfactory. In particular, the content of many microelements (nickel, vanadium, polyphenum, cobalt, etc.) in the human ration and excreta is at the limit of sensitivity of these methods. A preliminary concentration of the sample leads to a simultaneous increase in the interfering effect from other substances. The latter makes it necessary to isolate traces of elements in an analysis of different biological samples.

Applicable to spectral methods, it is best to have a group isolation of the trace of elements. This can be done successfully using the reagent hexamethylenedicitrodiacarbamate or hexamethylene ammonium (HMA) (N. N. Novikova, et al.). In contrast to the extensively used sodium diethyl dithiocarbamate this complex former is quite stable in acidic media (A. I. Bushv, et al.). Mixtures of different reagents (A. E. Likhachev, et al.) are used in the total isolation and concentration of metals in a number of cases.

In order to increase the effectiveness of extraction one can also use a mixture of organic solvents having a different nature (F. N. Tulyupa, et al.).

In this study we used a mixture of HMA reagents and 8-hydroxyquinoline (HQ), as well as a mixture of solvents, chloroform and isomyl (isobutyl) alcohol.

In perfecting the method we studied the effect of the ratio of reagents, temperature, and inorganic base on the degree of extraction of microelements as a function of medium pH. The initial working medium was an artificial solution simulating the approximate composition of mineralized urine. We used mixtures of chloroform and isomyl alcohol in the ratios 1.0:1.1, 1:1, 3:1, as well as chloroform and isobutyl alcohol in the ratio 3:1. The

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. STUDY OF THE DISCHARGE STAGES PRECEDING TOTAL BREAKDOWN OF A VACUUM DISCHARGE GAP IN THE PRESENCE OF LARGE ADDITIONAL RESISTANCES IN THE CURRENT CIRCUIT (FROM 1000 TO 1,000,000 OHMS). CURRENT AND VOLTAGE OSCILLOGRAMS SHOWED THE EXISTENCE OF A SHORT TERM ARC DISCHARGE WITH A COMBUSTION VOLTAGE OF SEVERAL KILOVOLTS AT A CURRENT INTENSITY OF 1.3 ANGSTROMS. BY PHOTOGRAPHING THE LUMINESCENCE IN THE DISCHARGE GAP, IT WAS REVEALED THAT A SPOT IS PRESENT AT THE CATHODE, WHILE A LUMINESCENT REGION FILLING A CONSIDERABLE PORTION OF THE GAP IS PRESENT AT THE ANODE. BETWEEN THE CATHODE AND THE ANODE IS A DARKER SPACE IN WHICH THE GAS AND VAPOR DENSITY IS EXTREMELY LOW. AN APPROXIMATE CALCULATION OF THE THICKNESS OF THE DOUBLE LAYER BETWEEN THE PLASMAS AT THE CATHODE AND THE ANODE GIVES VALUES CLOSE TO THE THICKNESS OF THE DARK SPACE. THIS GIVES RISE TO THE ASSUMPTION THAT THE HIGH VALUE OF THE COMBUSTION VOLTAGE OF AN ARC DISCHARGE IS CAUSED BY A LARGE POTENTIAL DIFFERENCE OCCURRING ON THE DOUBLE LAYER.

DATA PERTAINING TO THE ISOENZYME CHARACTERISTICS OF BURN STRESS AND ANAPHYLACTIC SHOCK

[Article by A.A. Pokrovskiy, K.A. Korovnikov, Institute of Nutrition, USSR Academy of Medical Sciences, Moscow; Vestnik Akademii Meditsinskikh Nauk SSSR, Russian, No 11, 1971, pp 51-58].

To date the biochemical mechanisms of onset of shock states have not been investigated enough. Most investigations published on this subject deal with processes of energy metabolism, including assay of a number of metabolites in the blood and tissues in the presence of different types of shock. Considerably less attention is given to the characteristics of different enzymatic systems (I.R. Patrov; F.A. Tigranyan; Yu.Yu. Keyvart et al.; M.Rone et al.; Brown; A.A. Pokrovskiy et al., 1969a, b).

To date there has been no comprehensive information in the literature about the change in isoenzyme spectra in the presence of different types of shock. Yet it can be assumed that enzymological investigations, especially dealing with tissue isoenzyme systems, will be significant in gaining understanding about the mechanism of onset of metabolic changes typically associated with shock.

According to the conceptions we are developing, the presence of genetically determined sets of isoenzymes in the organism is believed to be the result of prolonged molecular evolution of proteins directed toward functional differentiation of enzymatic systems existing in the organism which are isoconous with regard to substrate specificity (A.A. Pokrovskiy and K.A. Korovnikov, 1969-1971). At present, functionally different isoenzymes have been found in lactate dehydrogenase, malate dehydrogenase, hexokinase, creatine phosphokinase, and others (Bawam et al.; Swanson; Kaplan; Kitzen et al.; I.A.A. Pokrovskiy and K.A. Korovnikov, 1969, and others). For this reason it is logical to assume that in the presence of different states associated with stress reactions and severe changes in organ and system functions, there may be selective changes in activity of different isoenzymes, indicative of their metabolic dissimilarity. Evidently, it would be particularly promising to investigate the adrenals in this light; their functional activity should increase markedly in the presence of stress (V.K. Kulagin; Weichselbaum et al.; Timmer; G.L. Shreyber; R.I. Alekseyeva et al., and others).

[Abstracts: Moscow, Vestnik Akademii Meditsinskikh Nauk SSSR, Russian, No. 2, 1972, p. 96]

"Hedico-biological Investigations Dealing with the Use of Estrogens as Growth Stimulating Agents," by A.A. Polkovat'y, M.P. Nezzerin, G.P. Vaylitina, Ye.Yu. Ryazantseva, L.Yu. Solov'yova, p. 1.

An a result of medico-biological examination of meat products obtained from bull calves stimulated with diethylstilbestrol, it was shown that the recommended method of using this hormone does not rule out the possibility of retention in subproducts or meat of residual quantities of this agent. When feeding laboratory animals on experimental meat there was manifestation of some adverse effects on their development and change in sex gland function. On the basis of the data obtained and the literature, with due consideration of worldwide experience in using diethylstilbestrol to fatten various species of animals, the authors conclude that it is impossible to use this preparation in animal breeding.

There are eight tables, one illustration; bibliography lists 118 items.

"Experience with Vitamin E Supplementation for Bicycle Racers and Skiers," by Ye.A. Sakayev, V.V. Yaffetsov, p. 52.

A study was made of the effect of different intensities of physical stress on Vitamin E availability in the organism of cyclists and skiers during winter sport meets. As a result of the study it was found that 1.5-2 g content in the blood serum induces a considerable decline in Vitamin E content in the blood serum of the athletes. Additional intake of this vitamin in doses of 50-150 mg for cyclists who trained for 1.5-2 hours and 200-300 mg for skiers who trained for 3-4 hours raises the blood serum Vitamin E level and results in greater efficiency of the athletes.

Two illustrations; bibliography lists nine items.

"A True Antrectomy Technique in Surgery for Peptic Ulcers," by Yu.N. Pantseriev, A.A. Grinberg, T.I. Laktionova, p. 72.

A method is described for pinpointing the boundaries of the antral portion of the stomach during surgical interventions using 2% solution of Congo red dye as an indicator on the gastric mucosa. The method has been developed experimentally and used in clinical practice on 30 patients with duodenal and gastric ulcers; this revealed that it is simple, safe, and permits performance of a true antrectomy, in other words, it permits the performance of a functionally substantiated sparing operation on the stomach. The precision of the method was confirmed by histological examinations.

I.Yu. SOLOV'YOV, Institute of Nutrition, USSR Academy of Medical Sciences,
Moscow; Moscow, Vsesoyuznaya Akademiya Meditsinskikh Nauk SSSR, Russian, No. 2,
1972, pp. 3-15.)

In the last few years there has been intensive discussion in the special literature of the desirability of using various growth stimulants on farm animals (K.I. Burulin and Yu.N. Shashkov, 1956; Yu.P. Fomichev, 1967; Yu.N. Shchepetov, 1970).

Among such stimulants, some attention is being given to sex hormones and especially the synthetic analogues of estrogens. Proposals made in this area are based on experimental investigations conducted in the 1960s which revealed that androgens and estrogens (Kochakyan, 1935, 1946; Albright, 1942; Kruskal et al., 1955) have a definite anabolic effect.

It was shown that when using the same number of fodder units, administration of androgens and estrogens leads to a reliable increase in weight. Anabolism related mainly to accumulation of protein substances for androgens and with increased moisture and fat content in tissues. In addition, for estrogens the nature of stimulation of biosynthetic processes in this case is determined by species-related distinctions.

In the early 1950s, the research foundation of Iowa College received a patent for using diethylstilbestrol, a synthetic estrogen analogue, to fatten bull calves, and soon after this their suggestion was sanctioned by the Food and Drug Administration. This method consisted of adding 10 mg diethylstilbestrol daily to the animal's fodder. In 1955, the practice was also adopted of subcutaneous implantation of a diethylstilbestrol pill.

It must be noted that an increased weight gain is obtained when using this hormone only if a specific fodder composition is used, in particular a specific protein level, as well as proportion of protein to other components. Thus, it was noted that with an 11 percent protein content in the diet there was a marked anabolic effect, with 8 percent and more (12%) diethylstilbestrol did not have a beneficial effect on weight gain (Sharp and Neuman, 1962). The

MECHANISM OF ACTION OF APHLATOXIN IN REGENERATED HYPERTROPHIC LIVER FOLLOWING PARTIAL HEPATECTOMY
 Article by A. A. POKROVSKIY, N. V. VOLKOVSKAYA, N. V. LINDNER, M. M. GAPPONOV,
 A. I. SHCHEGOLEV, E. A. KORENKOVA, S. N. ABANOV, N. A. TIKHONOV. Institute of Nutrition, USSR
 Academy of Medical Sciences, Moscow; Yaroslavl, Vestnik Akademii Meditsinskikh
 Nauk SSSR, No. 1, 1972, pp. 45-56.]

Present conceptions about the mechanism of action of aphilatoxins (a group of highly toxic hepatocarcinogenic metabolites of some species of mold fungi) are reflected in several surveys (Nogai, 1966; Rous; A.A. Tukrovskiy; N.V. Lashnaya et al., 1972) and experimental articles (Clifford and Rees, 1967; King and Nicholson). To date extensive factual material has been accumulated which suggests that one of the mechanisms of toxic action of aphilatoxins (nuclease-like toxin to the liver, on the one hand, and marked hepatocarcinogenic effects, on the other) consists of interaction between aphilatoxins and liver cell RNA (Clifford and Rees, 1969). It was shown that aphilatoxin, like actinomycin D, forms complexes with the DNA molecule through attachment to adenine and guanine nucleic groups, so that the purine-phosphate bridge remains unaffected. Such interaction leads to impairment of the transcribing process (Lafleur and Fruton), i.e., to impairment of RNA-dependent RNA-synthesis. The consequence of this disturbance is inhibition of DNA- and RNA-polymerase synthetases which, in turn, is associated with rapid and visible suppression of hepatic RNA and DNA synthesis. The latter is demonstrable in particular in the case of a regenerated hypertrophic liver (DeReuck et al., 1965, 1966).

Some authors observed injury to the ribosomal system, consisting of breakdown of polysomes and change in their profile (Pons and Wogen, 1968). For this reason one would have expected aphilatoxin to suppress protein synthesis. This was confirmed in *in vitro* experiments (Smith; Clifford and Rees, 1967). Yet *in vivo* experiments failed to demonstrate distinct changes in incorporation of labeled precursors in the rat's liver proteins following administration of aphilatoxin (Shatz and Fiegel). In addition, it was possible to demonstrate aphilatoxin induced blocking of hormonal and substrate induction of some enzymes (Fagan and Frienden; Pons and Wogen, 1966).

"Data on the Functional State of the Adrenal Cortex during Experimental Insomnia in Rats"

Kiev, Ukrainskiy Biokhimicheskiy Zhurnal, Vol 42, No 3, 1970, pp 353-356

Abstract: Experimental insomnia was evoked in rats by placing them in a slowly rotating drum. During the first day, more than a threefold increase in 11-hydroxycorticosteroid content was observed in blood plasma and cholesterol in the adrenals was lowered by 50% and total lipids by 20%. On the fourth day the content of 11-hydroxycorticosteroids dropped by 33% in comparison to the original level, while cholesterol and total lipids were depressed 78% and 50%, respectively. The content of ascorbic acid in adrenal tissue decreased mainly at the expense of its reduced form, while in the blood serum the concentration increased, particularly that of dehydroascorbic acid. Animals evidently succumb in experimental insomnia because of insufficient synthesis of steroid hormones by the adrenals, which in turn may be the result of a breakdown in cholesterol synthesis and a low level of the reduced form of ascorbic acid.

"Prospects of Designing and Using Manipulators Controlled from Computers"

Moscow, Mekhanika mashin, No. 27-28, 1971, pp 45-55

Abstract: The manipulators of the title refer particularly to automatic devices, with or without a human operator, for undersea explorations, where the use of a human being is particularly dangerous if not impossible. The design of such manipulators is connected with the realization of unusually complex control algorithms which can be performed only by computers. The basic factors determining the technical-economic efficiency of computer-controlled or man-controlled manipulators are considered, under the assumption that the manipulator operates in a particular medium of specified variability depending on changing conditions. Such psychological factors as exhaustibility, error proneness, and limited working accuracy, are not taken into account. The basic stages in the process of automatic manipulator design are discussed, and the block dia-

"Mathematical Model of Impulse Generation by the Tonic Type of Neuron"

Moscow, Biofizika, No 4, 1973, pp 700-706

Abstract: To calculate the intensity of impulse generation by a neuron or group of neurons, the author proposes using instead of the Monte Carlo method a special case of Palm's formula:

$$\int_{-\infty}^t \phi(t', t) \mu(t') dt' = 1; \quad \phi(t', t) = 1 - F(t/t'),$$

where $\mu(t)$ is the intensity of a solitary random spike train, $\phi(t', t)$ is Palm's function, and $F(t/t')$ is the function of distribution of moments t at the end of the interval that started at moment t' . The nature and sequence of the computations is illustrated by two versions of a model of tonic neurons that can be used for a numerical analysis of the transformation of signals in neuronal circuits.

"The Problem of the Mechanism of the Generation of Electric Potentials in Nerve Tissue"

Moscow, Biofizika, Vol 15, No 5, Sep/Oct 70, pp 881-887

Abstract: A mathematical model is proposed for the mechanism of the development of the overall dendrite potential in a neuron structure. The model makes it possible to account for the anisotropy of the structure and the presence of fibers with various diameters. Dendrite fibers are replaced by arbitrarily arranged cylinders of infinite length. The time constant of the membrane, the length of linear sections of the dendrites, and the effects of branching are not taken into account. On the basis of the model proposed, an operator nucleus for the transformation of impulses into potential distribution is found. As an example nonuniform stimulation of a uniform isotropic structure is considered.

"Vibration-Resistant Differential Equations With a Continuous Right-Hand Side"

Moscow, Trudy Moskovskogo Matematicheskogo Obshchestva (Works of the Moscow Mathematical Society), Vol 27, 1972, pp 93-112

Abstract: There is isolated and studied the class of vibration-resistant differential equations $x(t) = Wu(t)$, where $x(t)$ is a vector function representing the state of an element, $u(t)$ is a scalar function representing control, W is an operator. Operator W is naturally determined for all continuous control functions. In an earlier article ("Vibration-Resistant Differential Equations," Doklady Akademii Nauk SSSR, Vol 195, No 3, 1970, pp 544-547), the authors announced a series of theorems dealing with vibration-resistant differential equations, both with continuous right-hand sides and with discontinuous ones. In the present article are presented complete proofs of the statements, from the above-cited article, pertaining to equations with continuous right-hand sides, and a number of new facts is established. 10 references.

"A Method for Analysis of Age Structure in the Small Five-Toed Jerboa Allactaga Elater (Licht.)"

Moscow, Ekologiya, No 4, 1971, pp 88-89

Abstract: A special method for age analysis, especially adapted to the small rodent Allactaga elater was developed, since existing techniques for analyzing bone and tooth structure or length of tooth roots were not suitable for this species. A modification of standard methods for determining age by the degree of wear on tooth crowns was chosen, and a method of graphic analysis (Smirnov, 1960) was used which did not require animal tagging and recapture for exact age samples.

Since considerable differences in degree and manner of M_1 , M_2 , M_3 wear (interior or exterior side) were observed in various 1/2

animals, a mean "age index" was developed, representing a total of six different measurements: the total height for the crowns of all three molars on one of the mandibular bones, measured on both the inside and on the outside. Since in the aging process the animal's tooth crowns wear down, this index should decline in proportion to age.

Distribution groupings from population analyses taken on III/68, IX/68 and V/69 showed that this species in the region investigated (Ferganda valley) had two distinct reproductive periods, the spring and fall, and that the life span of *Alactaga elater* corresponds to the general span for small murine rodents.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE ARTICLE ANALYZES 127 OPERATIONS PERFORMED FOR COARCTATION OF THE AORTA IN CHILDREN, AGED FROM 2 MONTHS TO 15 YEARS. FEATURES PECULIAR TO THE CLINICAL COURSE OF AORTIC COARCTATION AND PROBLEMS OF DIAGNOSIS IN NURSLINGS ARE DESCRIBED. IN THE CLINICAL COURSE OF AORTIC COARCTATION IN CHILDREN THREE PERIODS ARE SINGLED OUT: (1) CRITICAL, (2) PERIOD OF ADAPTATION AND (3) PERIOD OF COMPENSATION, THIS REQUIRING THE CORRECT CHOICE OF THE MODE OF THERAPY. THE AUTHORS HAVE ELABORATED THE INDICATIONS TO THE OPERATION OF RESECTION OF AORTIC COARCTATION IN CHILDREN WHICH ARE DIFFERENT IN EACH AGE GROUP AND SHOULD TAKE INTO CONSIDERATION THE PATIENT'S AGE, SEVERITY OF THE STATE, POSSIBILITY OF SUBSEQUENT GROWTH OF THE ANASTOMOSIS, ETC. THE TECHNIQUE OF DIFFERENT TYPES OF OPERATIONS AND CHOICE OF THE METHOD DEPENDING UPON ANATOMICAL CONDITIONS AND PATIENT'S AGE ARE DESCRIBED IN DETAIL. THE TOTAL MORTALITY COMPRESSED 7.9PERCENT OF CASES. WITH ACCUMULATION OF THE SURGICAL EXPERIENCE AND AFTER THE ELABORATION OF PRINCIPLES OF POSTOPERATIVE MANAGEMENT OF PATIENTS FROM 1967 OUT OF 49 OPERATIONS, INCLUDING 10 IN EARLY CHILDHOOD, THERE WAS NOT A SINGLE LETHAL OUTCOME. ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS ASSERT THAT INDUSTRY HAS RECENTLY BEEN MAKING INTENSIVE USE OF DEFECTOSCOPES WITH SCINTILLATION RADIATION SENSORS WHICH CAN PROVIDE A SENSITIVITY FOR STEEL OF UP TO 0.2 TO 0.5 PERCENT UNDER IRRADIATION BY THE CU-60 ISOTOPe. HOWEVER, WITH SUCH EQUIPMENT IT IS DIFFICULT TO INTERPRET THE CONTROL RESULT AND RECOGNIZE THE NATURE OF THE DEFECT. CONSEQUENTLY, THIS METHOD SUFFERS IN COMPARISON WITH THAT OF RADIOGRAPHY. ATTEMPTS HAVE BEEN MADE TO CORRECT THIS DEFECT, BUT HAVE FAILED TO GIVE THE SAME HIGH SENSITIVITY DUE TO POOR INDICATOR EQUIPMENT. THIS PAPER GIVES THE FIRST RESULTS OBTAINED IN TESTS OF A DEFECTOSCOPE CONTAINING A SCANNED RADIATION SENSOR AND A CATHODE RAY TUBE AS INDICATOR. THE RESULTS SHOW THAT THE SYSTEM TESTED IS A SUPERIOR INSTRUMENT WITH BETTER SENSITIVITY AND RESOLUTION THAN THE OTHERS. A BLOCK DIAGRAM OF THE EXPERIMENTAL EQUIPMENT IS GIVEN, IN WHICH THE RADIATION SOURCE IS CS 137, AND THE DETECTOR IS A CRYSTAL MEASURING 20 BY 30 MM AND A PHOTOELECTRIC MULTIPLIER FEU-16.

THE CLINICAL PICTURE AND DIAGNOSIS OF ANGINA
ABDOMINALIS

A. V. Pokrovskiy, B. I. Bragin, I. I. Rusanov, L. S. Zingerman
Summary

Among 281 patients with obstructive lesions of the abdominal aorta and its branches the authors revealed 47 persons with occlusions of the visceral vessels; of this number in 20 cases they occurred as the result of nonspecific aortoarteritis and in 27 - of atherosclerosis; only in 24 patients there were clinical manifestations of the disease.

As a rule, the clinical picture of angina abdominalis occurred in affection of two or three branches; only in isolated lesion of the splanchnic artery there were definite clinical manifestations. Routine clinical examination enables in most cases to suspect the true nature of the pathology and the final diagnosis is established during X-ray investigation (preferably serial) in the dorsoventral and lateral projections.

SURGICAL TREATMENT OF ANGINA ABDOMINALIS

A. V. Pokrovskiy, B. I. Bragin, V. S. Rabotnikov and D. M. Tsireshkin

The paper deals with the problems of diagnosis and surgical treatment of the abdominal ischemic syndrome. The authors have observed 24 patients with angina abdominalis in investigation of 281 patients with atherosclerotic occlusion of the abdominal aorta and its branches. Eight patients with angina abdominalis were operated upon with one lethal issue. It is considered that: 1) the established diagnosis of angina abdominalis is an indication to surgical therapy; 2) the approach — median laparotomy in extraval sal compression of the celiac artery, left — sided thoracolaparotomy in all other cases; 3) an end-to end distal anastomosis in reconstructive operations seems to be more rational, it is more advantageous hemodynamically; 4) recognition and surgical treatment of angina abdominalis in due course eliminating ischemia enabled to avoid lethal intestinal infarction.

THE NEUROLOGICAL SYMPTOMATOLOGY OF ATHEROSCLEROTIC
ANEURYSMS OF THE ABDOMINAL AORTA WITH LERICHE'S SYNDROME

N. K. Bogolepov, A. V. Pokrovskiy, N. P. Barinov

The report deals with an analysis of neurological disorders in 13 patients with atherosclerotic aneurysms of the abdominal aorta and with the syndrome of Leriche. The following neurological syndromes could be elicited in this form of pathology: 1) vegetative-trophic; 2) radiculo-neuritic; 3) syndromes of spinal insufficiency — transitory and stable. The clinical picture as a rule was characterized by changes of the sacrolumbar plexus and its separate branches, changed vegetative innervation and affection of the spinal marrow. An analysis of neurological changes in this form of pathology as the authors assume, gives a supplementary criteria for early diagnosis, for the localization of the pathological process and the determination of the stage in the course of the disease.

"Several Ways of Raising the Sensitivity of the Scintillation Method of Betatron Defectoscopy"

Izv. Tomsk. politekhn. in-ta (News of Tomsk Polytechnical Institute), 1970,
Vol. 184, pp 136-139 (from RZh-Fizika, No 1, Jan 71, Abstract No IA430)

Translation: Fluctuation phenomena in the electric circuits in the detection-recording section of a betatron defectoscope are analyzed on the basis of probability theory and mathematical statistics. It is shown that the most promising way of raising the signal-to-noise ratio in betatron defectoscopy with scintillation counters is the application of comb-shaped filters in the recording circuits.

"Hydrodynamic Noise and Vibration of Centrifugal Pumps"

Nauchn. tr. NII stroit. fiz. Gosstroya SSSR (Scientific Works of the Scientific Research Institute of Structural Physics of Gosstroy USSR), 1970, No 1(13), pp 5-25 (from RZh-Fizika, No 12(II), Dec 70, Abstract No 12Zh773)

Translation: A study of vortex noise and vibration was carried out on smooth rods with different profiles rotating in a cylindrical body; in tubes with different roughness placed in the wind tunnel of the All-Union Scientific Research Design and Technological Institute of Hydraulic Machinery, and also on pumps with wheels and helixes of different roughness encountered in practice in pump construction. It was established by the experiments that the intensity of the noise and vibration generated by the vortex sources of oscillations is proportional to the 6th power of the velocity and the 2nd power of the characteristic dimension of the body. A change in the mass, elastic properties, and internal quenching of the material of the rods does not affect this law. The spectra of vortex noise and
